numerical linear algebra is far too broad a subject to treat in a single introductory volume stewart has chosen to treat algorithms for solving linear systems linear least squares problems and eigenvalue problems involving matrices whose elements can all be contained in the high

speed storage of a computer by way of theory the author has chosen to discuss the theory of norms and perturbation theory for linear systems and for the algebraic eigenvalue problem these choices exclude among other things the solution of large sparse linear systems by direct and iterative methods linear programming and the useful perron frobenious theory and its extensions however a person who has fully mastered the material in this book should be well prepared for independent study in other areas of numerical linear algebra

matrix algorithms are at the core of scientific computing and are indispensable tools in most applications in engineering this book offers a comprehensive and up to date treatment of modern methods in matrix computation it uses a unified approach to direct and iterative methods for linear systems least squares and eigenvalue problems a thorough analysis of the stability accuracy and complexity of the treated methods is given numerical methods in matrix computations is suitable for use in courses on scientific computing and applied technical areas at advanced undergraduate and graduate level a large bibliography is provided which includes both historical and review papers as well as recent research papers this makes the book useful also as a reference and guide to further study and research work

this volume is the first in a self contained five volume series devoted to matrix algorithms it focuses on the computation of matrix decompositions that is the factorization of matrices into products of similar ones the first two chapters provide the required background from mathematics and computer science needed to work effectively in matrix computations the remaining chapters are devoted to the lu and qr decompositions their computation and applications the singular value decomposition is also treated although algorithms for its computation will appear in the second volume of the series the present volume contains 65 algorithms formally presented in pseudocode other volumes in the series will treat eigensystems iterative methods sparse matrices and structured problems the series is aimed at the nonspecialist who needs more than black box proficiency with matrix computations to give the series focus the emphasis is on algorithms their derivation and their analysis the reader is assumed to have a knowledge of elementary analysis and linear algebra and a reasonable amount of programming experience typically that of the beginning graduate engineer or the

undergraduate in an honors program strictly speaking the individual volumes are not textbooks although they are intended to teach the guiding principle being that if something is worth explaining it is worth explaining fully this has necessarily restricted the scope of the series but the selection of topics should give the reader a sound basis for further study
